FORT HUACHUCA, ARIZONA 85613

DISPOSITION INSTRUCTIONS

Destroy this document when no longer needed.

Do not return it to the originator.

DISCLAIMER

The use of trade names in this document does not constitute an official endorsement or approval of the use of such commercial hardware or software. This document may not be cited for purposes of advertisement.

AVAILABILITY

Inis publication is availabe to non-Government agencies and may be purchased through the Defense Technical Information Center, Cameron Station, Alexandria, VA 22314.

Government activities may requisition copies by writing to the Commander, Headquarters, Fort Huachuca, ATTN: CCH-PCA-ASP, Fort Huachuca, AZ 85613

NEUTRAL

Ine word "he" when used in this publication represents both the masculine and feminine genders, unless specifically stated otherwise.

CERTIFICATION

The certifications/verifications contained in this publication are essential to the conduct of the business of the Government.

LIST OF TABLES

Tables	<u> Title</u>	Page
2-1	Equipment Characteristics	2-15

SECTION 1. GENERAL

1.1 packground. The US Army Communications-Electronics Engineering Installation Agency (USACEEIA) is responsible for engineering and installation of communications-electronics (C-E) equipment for the standard remote terminal (SRI). The SRI has been developed to replace existing communications terminals that are becoming obsolete due to lack of modern functional capabilities, the age of components with the resulting difficulty to repair, and to satisfy new requirements. It includes a family of standardized, automated data communications equipment which will interface with the US Army's automated multimedia exchange (AMME) and other data switching centers of the Defense Communications System (DCS). This standard engineering installation package (SEIP) will provide engineering and installation data, site survey criteria, quality assurance provisions, and test plan guidance in preparing an engineering installation package (EIP) which will be tailored to meet specific site requirements.

1.2 General System Description.

- 1.2.1 <u>SRT</u>. The SRT is a digital communications terminal with COMSEC equipment which provides various data/message capabilities through the use of modular hardware components. The SRT includes a line control unit (LCU) which operates with the following peripherals: paper tape equipment (PTE), an optical scan unit (OSU), a low speed page printer (LSPP), a medium speed line printer (MSLP), a high speed line printer (HSLP), a storage module disk drive (SMDD), magnetic tape units (MTU), a card reader (CR), and a card punch (CP), and COMSEC equipment. The SRT will perform all of the usual functions required to receive, process, store, transmit and retrieve both narrative and data traffic in both secure and nonsecure communications centers.
- 1.2.2 Line Control Unit. Each SRT installation will require an LCU which provides all necessary components for system operation, but does not include the peripheral devices and their interfaces. Included in the LCU are a processor and read-only memory which comprise the macroprocessor. Other components of the LCU are the diskette drive, operator panel, visual display unit, and control panel. An electronic bay in the LCU contains the communications interface, logic rack, macroprocessor, random access memory, other electronics and interfaces, power supplies, and cabling.
- 1.2.3 Paper Tape Equipment. The paper tape punch (PTP) is mounted in a single cabinet which also contains the paper tape reader (PTR). Both units have adjustable tape guides permitting use of 11/16-inch, 1/8-inch, or 1-inch-wide paper tape. Eight level American Standard Code for Information Interchange (ASCII) and five level International Ielegraph Alphabet-Number Two (ITA-2) codes can be used. Punch speed is 120 characters per second and read speed is 150 characters per second.

1.2.4 Optical Scan Unit. The OSU automatically feeds red printed DD Form 1/3 messages and reads at a rate of 150 characters per second. The USU has its own processor which provides control logic, character recognition, and the OSU processor interface.

- 1.2.5 Low Speed Page Printer. The LSPP is capable of printing one to six copies using paper up to 9.5 inches wide. The LSPP can print 100 characters per second, 80 characters per line with double- or single-space printing.
- 1.2.6 Medium Speed Line Printer. The MSLP prints at 165 lines per minute, up to 132 characters per line, and uses paper up to 14-7/8 incnes wide. Up to six-part printer paper may be used and double- or single-space printing may be selected.
- 1.2.7 High Speed Line Printer. The HSLP increases printing speed to 500 lines per minute and can use paper up to 19 inches wide. Other printing characteristics are essentially the same as the MSLP.
- 1.2.8 Storage Module Disk Drive. The SMDD stores messages for subsequent retrieval. It has a capacity in excess of 40 million characters.
- 1.2.9 Magnetic Tape Unit. The MTU uses 1/2-inch-wide tape and 10-1/2-inch reels. It is available in 7- or 9-track configurations and will record up to 1,600 characters per inch. Read and write operations are performed at 37.5 inches per second. Rewind is at 150 inches per second.
- 1.2.10 Card Reader and Card Punch. Both the CR and CP use the standard 80-column cards (binary or Hollerith code). The CR reads 300 cards per minute, and its hopper and stacker accommodate 1,000 cards each. The CP punches 100 cards per minute. Its two hoppers each have a capacity of 1,000 cards and the two stackers will hold 850 cards each.
- 1.2.11 Key Generators, $\Gamma SEC/KG-13$ and $\Gamma SEC/KG-34$. Both key generators provide bulk encryption and decryption for the system. Both generators use Modems MD-674(P)/G, or MD-701B/UY, or the LSI 4800. However, only the $\Gamma SEC/KG-13$ will use a CAU, the AN/UYK-22 or the SN-394(V)/G.
- 1.2.12 Crypto Auxiliary Set, AN/UYK-22(V). The AN/UYK-22(V) provides red/plack interface between data terminal and data modems, and the interface with and synchronization capability for key generator, TSEC/KG-13.
- 1.2.13 Modem, Low Speed Wire Line, MD-674(P)/G. The MD-674(P)/G transmits serial digital information over four-wire voice frequency channels. The modem operates at synchronous modulation rates of 150, 300, 600 and 1200 band and at asynchronous modulation rates up to and

including 150 baud. The MD-674(P)/G is not functional without the Clock Module Group, 0A8072/G which provides the necessary timing for the control of phasing and timing for associated terminal equipment.

- 1.2.14 Electrical Sychronizer, SN-394(V)/G. This crypto ancillary unit (CAU) establishes and maintains synchronization with distant terminal during secure mode of operation for TSEC/KG-13. It also provides an interface for signal and timing lines between the terminal equipment, crypto equipment, and modems.
- 1.2.15 Digital Data Modem, MD701B/UY. The MD-701B/UY transmits and receives serialized digital data at speeds of 600, 1200, or 2400 bits per second (bps) over a standard 3 kHz voice channel.
- 1.2.16 Modem, LSI 4800. LSI 4800 Data Modem processes serial digital data for transmission ofver a 4-wire telephone circuit. It operates synchronously at 2400 and 4800 bps.

1.4 Comments on Publication.

- a. Users of this publication are invited to submit recommendations for its improvement. Comments should be keyed to the drawing, page, paragraph, and line of the text for which the change is recommended. For convenience, a mailing card is bound with this SEIP. Comments should be sent directly to the Commander, HQ USACEEIA, ATTN: CCC-CED-STD, Fort Huachuca, Arizona 85613.
- b. Requests for USACEEIA regulations and forms should be addressed to the Commander, HQ USACEEIA, ATTN: CCC-DRM-P-R, Fort Huachuca, Arizona 85613.

SECTION 2. SITE SURVEY DATA AND CHECKLIST

- 2.1 General. This section provides the information needed for preliminary engineering, equipment layout, and site survey associated with installation of the SRI.
- 2.2 Site Survey Criteria. The site survey should be conducted in accordance with the guidelines and criteria set forth in Defense Communications Agency Circulars 370-160-3, and Site Survey Data Book for Communications Facilities. In addition, the physical and electrical security requirements, as outlined in (C) AR 530-4 and (C) MIL-HDBK-232, must be satisfied when selecting a site location and specifying power and construction design criteria.
- 2.2.1 Site Survey Checklist. The site survey data checklist (fig. 2-1) should be used as a guide by the survey team for identifying and assembling the required technical data during the site survey.
- 2.2.2 Additional Site Survey Items. The following items, as applicable, may be included in the SRT site survey checklist:
- a. Floor plan of building containing controlled area (if any) indicating occupants and equipment adjacent to controlled area (reproducible from district engineer or using unit).
- p. Layout indicating buildings and equipment within 200 feet of controlled area (if any) and indicating occupants and electrical equipment in buildings (reproducible from district engineer).
- c. A line drawing of existing electrical distribution and power supply system. If possible, show required changes or additions to meet the new requirements.
- d. Copy of DA Form 2701, Job Order Request, or Military Construction Army (MCA) project previously submitted, if any.
 - e. Installation Site floor plan sketch to scale.
 - f. Current local telephone directory.
- g. Applicable security agency comments and satisfactory RED/BLACK inspection reports with any changes required.
- h. Comments on any anticipated difficulties in the flow of materials, work, or personnel in the operation area.
- i. Memorandum of Understanding between using unit, Project Engineer, District Space Coordinator.

2.2.3 Use of the Site Survey Checklist. The checklist, when completed, will be used to assist in the preparation of an official site survey report with equipment layout drawings. The site survey report will be an inclosure to the project coordination letter which must be forwarded through responsible agencies for concurrence/nonconcurrence and/or comments.

- 2.3 <u>iquipment Characteristics</u>. The physical and electrical characteristics of equipment are given in Table 2-1. This table may be used in arriving at site requirements for overall space, ac power, floor loading, and air-conditioning.
- 2.4 <u>cquipment Floor Plan Layouts</u>. Example SRT floor plan layouts are shown on the drawings in section 4. The project engineer responsible for the MODEM installation will determine the type of mounting (rack, table, or wall) to be used. Sites with continuous security will use either rack or table mounting for COMSEC equipment as deemed necessary by the project engineer. Terminals processing classified traffic in unsecure rooms must use an approved class 5 secure equipment cabinet for the COMSEC equipment.
- 2.5 Standard Remote Terminal Circuits. During the site survey the circuit and circuit speed will be checked against the Telecommunications Requirements (TileR) submitted. The site survey team will then ensure that appropriate telecommunications service requests will be prepared by the Operations and Maintenance (O&M) command.
- 2.6 Standard Remote Terminal Signal Cables. The SRT signal cables are contractor supplied prefabricated assemblies. Each assembly consists of a number of snielded pairs (or twinax) that are bundled together within an overall shield, and terminated to connectors at each end. It will be the responsibility of the project engineer to provide the cable contractor with the exact length of each cable required. These lengths are of extreme importance since cables that are too short will require resupply with the attendant delays and probable increase in cost, while cables that are too long may detract from the professional appearance of the finished installation.
- 2.7 Main Power Service. The responsibility for providing adequate power service for the SRT rests with the facility engineer (or construction design agency). Under extreme circumstances, they may not be able to provide power service that meets all required parameters. In that event, it may be necessary to use inverters or frequency converters. These can be used to change the available power source voltage or frequency to a regulated voltage at a specified frequency. Iney are also used wherever the power source is not capable of providing the frequency stability, voltage regulation, or noise isolation required by a specific application. It is the responsibility of the project engineer to coordinate with the facility engineer during the site survey to determine if special power correcting equipment will be required.

30 Uctober 1981 SEIP 041

2.8 <u>Raised Flooring</u>. All SRT's will be installed on raised flooring or with partial raised flooring behind the SRT equipment. The raised flooring requirement shall be specified in the Site Preparation Plan. Installation of the raised flooring will be the responsibility of the UKM commands. Maximum neight of partial raised floors will not exceed 7-1/2 inches.

2.9 Cable and Wire Running Lists. Cable and wire running lists shall be prepared by the Project Engineer for inclusion in individual engineering installation packages (EIP).

SECTION 3. INSTALLATION SPECIFICATIONS AND INSTRUCTIONS

- 3.1 <u>General</u>. These instructions, together with applicable directives and established criteria, provide the guidance necessary for proper installation of the SRT. Installation instructions for individual sites will be provided in EIP's prepared for those sites.
- 3.2 <u>Documentation and Applicable Directives</u>. All changes or alterations to engineering drawings shall be marked in red for additions, yellow for deletions, and notes in blue; submitted to Commander, US Army Communications-Electronics Engineering Installation Agency, ATTN: CCC-CED-DCD, Fort Huachuca, Arizona 85613, for coordination and incorporation of applicable changes. Installer personnel must be familiar with, and will be guided by (C) MIL-HDBK-232, (C) AR 530-4, TO 31-10 Series, CCCP 105 Series and NFPA 70 Series.
- 3.3 <u>Installation Detail</u>. The following steps provide typical procedures and sequence of events for installation of the SRT. All SRT installations use raised flooring.
- 3.3.1 Order of installation. The SRT equipment should be installed in sequential steps to assure compliance with the installation drawings. Minor changes to the sequence of installation procedures may be made in consideration of available manpower, material, equipment, and facilities. The following sequence is suggested:
- 3.3.2 <u>Inventory</u>. Inventory material and equipment and establish storage and control procedures. Coordinate secure storage requirements during nonworking hours with the O&M command.
- 3.3.3 <u>Layout</u>. Lay out the equipment floor plan and establish reference working lines and location points. Drawing STD-SD-0074 shows a typical SRT layout.

to the management and the constitution of the second secon

- 3.3.4 Equipment Racks/Cabinets. Install the equipment racks and/or cabinets and secure them to the floor using specified hardware. Using the reference lines and points, cut holes in the floor panels as appropriate.
- 3.3.5 Power Conduit. Position the SRT equipment in the proposed locations and install ac power conduits beneath the raised floor to the SRT units and to the SRT power distribution panel using drawing STD-SD-0074. Mount the equipment in racks, cabinets, or on shelves and install the power conduits as shown on the applicable drawings listed in section 4 of this SEIP. Figures 3-1 through 3-3 show typical equipment layout in relay racks.
- 3.3.6 <u>Power Cables</u>. Install all ac power cables in conduit. At the power panel, terminate the cables to the appropriate circuit breakers (drawing STD-SD-0074); and at the equipment, terminate to the appropriate power

SEIP 041 30 October 1981

connector supplied with each unit of the SRT, and to the utility ac boxes on the equipment racks or cabinets. Observe all safety precautions and make the proper checks before terminating.

- 3.3.7 Signal Conduit. Install the data line interface box (DLIB) (Figure 3-4, drawings STD-SD-0069 and SAAD-D-40630) in the engineered location and run the conduit to the red patch rack/cabinet. Install the remaining signal conduit as required form the red patch rack/cabinet to the synchronizer/COMSEC rack or cabinet; to the digital/vf patch and modem rack/cabinet; to the external signal entrance box. If the modem is not located in the same rack as the digital and VF patches, run conduit between modem and patches. For installations not requiring patch panels, run conduit from the DLIB to synchronizer/COMSEC rack or cabinet; to the modem; and to the external signal entrance box.
- 3.3.8 <u>Signal Cables</u>. Install the prefabricated signal cables from the LCU to the peripheral equipment, under the raised floor. These cables are prefabricated and cut to specific lengths. Refer to figure 3-5 for proper cable designations. Install the remaining signal cables in the applicable conduits. Check before terminating.
- 3.3.9 <u>Cable Crossover</u>. A unistrut separator will be erected at the crossover point where the power conduit cable run and the signal cable run meet (fig 3-6). The two (2) cable runs will be separated a minimum of 4". Two (2) unistruit supports, one (1) on each side of the crossover, shall be used. Separation will be determined by the Project Engineer.
- 3.3.10 <u>Patch Panel</u>. Cooke patch panel, 153 series, are used for digital and audio, RED or BLACK. STD-SD-0068 drawings shows the patch panel and its wiring diagram.
- 3.3.11 <u>TSEC/KG-13</u>. Depending on the type of modem used with the TSEC/KG-13, use drawings $\overline{STD-SD-0067}$, $\overline{STD-SD-0034}$, and $\overline{STD-SD-0073}$. Use drawings $\overline{STD-SD-0052}$, $\overline{STD-SD-0076}$, and $\overline{SAAD-D-40683}$ when $\overline{TSEC/KG-13}$ uses the $\overline{AN/UYK-22}$. Drawing $\overline{STD-SD-0066}$ shows the interconnect between the patch panel and the $\overline{TSEC/KG-13}$.
- 3.3.12 TSEC/KG-34. Make only authorized punchouts on the equipment. Drawing STD-MS-0004 shows the signal and power cables and conduit installation for the TSEC/KG-34. Drawing STD-SD-0028 shows TSEC/KG-34 with modem, MD-674.
- 3.3.13 <u>Secure Cabinet</u>. Drawing COM-CM13-003 shows the secure equipment installation in a Mosler safe.
- 3.3.14 Non-Secure Modem. Drawing STD-SD-0029 shows Modem, MD-674 installation in a non-secure area.

30 October 1981 SEIP 041

3.3.15 Modem Installation. In CONUS, modems will be furnished and installed by the contractor. Overseas installation the Government will provide and install modems.

- 3.3.16 Cutover Information. Sequential steps required to make the cutover are developed jointly by the O&M command and USACEEIA.
- 3.3.17 Equipment Removal Instructions.
 - a. Remove equipment to be removed as soon as possible after cutover.
- b. Instruction for the movement of any unique equipment should be discussed with the project engineer, installation supervisors, and 0&M personnel.
 - c. All unused cable shall be removed from the communications center.

SECTION 4. ENGINEERING INSTALLATION DRAWINGS

- 4.1 GENERAL. The engineering installation draw s provided in this section depict typical floor plans, equipment placement, conduit runs, and electrical interface/interconnections.
- 4.2 MODIFICATION OF INSTALLATION DRAWINGS. The engineering drawings may be modified during and after installation of a project to reflect adaptation to local physical and environmental conditions. Copies of modified drawings should be retained on site and changes, corrections, and deletions forwarded to the responsible area's communications-electronics engineering installation agency.
- 4.2.1 USACEEIA drawings. The engineering installation drawings included are II-I/2 by I6 inches, foldout type, and are not to scale format. The scale referenced on these drawings refer to D size drawings only. The drawings are:

NOTES:

- 1. THIS PARTS KIT IS DESIGNED TO SPEED CALLOUTS & INSTALLATION OF KG-13(S).
- 2. THE KG-13(5) & UYK-22 ARE ORDERED ON THE SITE
 BILL OF MATERIALS. ORDER A DUAL UYK-22 WHETI
 TWO (2) KG-13(5) ARE TO BE INSTALLED. ADDTNL HROWR OF F/N 17 USED TO MOUNT.
- 3. USE F/NS 6, 7, 8, & IG FOR WIRING. SEE SCHEMATIC, SHT. 3.
- 4. USE F/N 12 TO PLUG UNUSED ENTRANCE HOLE IN F/N3 USE IN UPPER OR LOWER AS REQUIRED BY ACTUAL INSTALLATION
- 5. CONDUIT ENTRANCE FROM OVERHEAD OR ELOW FLOOR DUCT IS OPTL. THE CONDUIT AND FITTINGS OTHER THAN THOSE FURNISHED IN THIS KIT MIST EE SUFFLIED BY THE SITE BILL OF MATERIALS. ALL ITEMS FURNISHED ARE SHOWN IN SOLID LINE. ITEMS SHOWN DASH LINE TO BE FURNISHED IN SITE BILL OF MATERIAL.
- 6. F/N 2 IS TO BE MOUNTED TO KG-13 CASE GROUND STUD LOCATED AS SHOWN...
- 7. CABLE SHIELD IS TO BE CONNECTED TO STUD IN BOX USING TERM LUG F/N 3.
- 8. ON SHEET 3, SCHEMATIC, ALL WIRING IS RUN INSIDE CONDUIT.
- 9. INSTALLATION OF GROUND SYSTEM CONDUIT IS OPTIONAL AND DEPENDANT ON SITE REQUIREMENTS.
- IQ CUT CONDUITS TO EXACT LENGTHS REQUIRED.

SECTION 5. BILL OF MATERIALS

5.1 GENERAL. A master bill of materials (BOM) is provided as a guide in ordering the material to accomplish installation of the SRT. Items are identified by systems material list (SML) number and/or national stock number (NSN). When both of these numbers are not available, the manufacturer's part number and item description are provided. The number of configurations in which the SRT can be installed makes it impractical to provide separate drawings and separate BOM's for each type of installation. Similarly, the areas in which the installations are made can be of various types of construction. Project engineers for each engineering installation package (EIP) must site adapt each SRT installation using the requisite items listed in the master BOM.

SECTION 6. QUALITY ASSURANCE PROCEDURES

- 6.1 General. The quality assurance (QA) procedures for this SEIP have been developed in accordance with the provisions and criteria of CCR 702-1-2. The QA program specified, will be implemented to provide assurance that the specified equipment and facilities have been installed in accordance with the requirements and criteria of this SEIP and are acceptable for use by the operating agency.
- 6.2 References. The following references apply to this QA program:
- a. USACC Regulation Number 702-1-2, 17 January 1980, "USACC quality Assurance Program for Engineering, Installation and Acceptance of Communications-Electronics Equipment and Systems."
- b. US Army Communications-Electronics Engineering Installation Ageny (USACEEIA) Regulation Number 702-1, 17 January 1980, "USACEEIA Quality Assurance and Testing Program."
- c. USACEEIA Regulation Number 702-2, 1 January 1979, "Preparation of Documentation for Test and Evaulation of Communications-Electronics Materiel."

SEIP 041 30 October 1981

systematic approach for assessing quality during installation and acceptance and for early correction or any discrepancies or deficiencies revealed through inspection and test. The QA functions will begin at the earliest stages of project implementation and end only after all possible corrective actions are completed, and the equipment is released to the operating or user agency. QA functions are to be performed by personnel operating independently from those charged with the engineering or involved in the installation. Under the program, these functions are divided among three participating organizations: (1) the test agency, (2) the installation agency, and (3) the operating agency.

- 6.3.1 Test Agency. The test agency will be responsible for performing QA and acceptance testing. As the manager of the QA program for this project, the test agency will commence project planning as soon as tasked. The test agency QA representative (QAR)/test director is responsible for periodic QA inspections and acceptance test in accordance with management provisions of CCCR 702-3 and this SEIP. These QA inspections and tests will be performed at the discretion of the test agency for the purporse of assessing the effectiveness of the QC effort by the installation agency, initiating corrective actions as appropriate, and determining the extent to which the installation adheres to quality requirements. Acceptance testing in conducted in accordance with section 7 to determine if the installed equipment complies wih the technical requirements of this SEIP and is suitable for the intended application. At the earliest stages of the project initiation, the test agency will appoint a QAR/test director. For project coninuity and effective management, a single individual should be assigned both roles. This will assure that the QA and test efforts are fully integrated and the following actions are expditiously accomplished:
- a. Implement the QA concepts and reqirements identified in this SEIP.
- ${\tt D}.$ Assure that the participating agencies and organizations are thoroughly familiar with their respective roles in support of QA, QC, and testing.

A STATE OF THE STA

c. Validate QC and installation efforts for compliance with stated reuirements through the used of project oriented reports, project status review, onsite inspections, etc. When an inadequacy is found in the installation agency's QC effort, the procedures of CCCR 702-1, will be applied. Follow-up actions will be monitored and those discrepancies or differences which cannot be resolved in a timely manner will be brought to the attention of higher authority.

30 October 1981 SEIP 041

d. Identify representatives by recording the necessary information on USACEEIA Form 113-R, Cognizant Agency, Command, and Facility QA Points of Contact (fig. 6-1). This form becomes a part of the project files and will be updated as necessry to assure orderly project execution. The dissemination of this information to the participants in the QA program is encouraged.

- e. Perform a final QA inspection using USACEEIA Form 111-R, Quality Assurance Checklist (fig. 6-2), tailored to the specifics of this effort. This SEIP and USAF TO's shall be the evaluation criteria for site inspection. This inspection will consist of thorough visual and mechanical observations of the installed materiel, QC records, and other factors to evaluate the acceptability and quality of the work performed.
- f. Conduct acceptance tests in accordance with the provisions of section 7 of this SEIP, the subsidiary documents specified therein, and CCCR 702-3. If the results of any test are unsatisfactory, corrective action shall be initiated through onsite engineering and installation and operational participants. In the abscence of such representation, corrective action will be initiated through channels. The QAR/test director shall retest after corrective actions have been completed and verify that discrepancies were corrected. After satisfactory resolution, he may resume acceptance tests. If test discrepancies cannot be resolved by onsite personnel, the QAR/test director will: (1) Reject the equipment and/or installation and terminate testing until the problem is corrected or resolved, or (2) Attempt to complete the acceptance tests noting the discrepancies and deficiencies as exceptions on USACEEIA Form 98-R, Technical Acceptance Recommendation (TAR). The participating agencies and organizations will be notified of these discrepancies and deficiencies at the earliest practical date.
- g. Record and analyze test results, determine acceptability of the installed equipment, summarize findings and distribute the TAR to the designated participants. Prepare a final test report in accordance with CCCR 702-2. Project tasking documents will usually provide the distribution requirements. The acceptance test report will note installation and operational exceptions and recommend corrective actions to be taken by the responsible and participating agency(ies). The test report will document project completion. Subsequent correction of exceptions will be documented by separate correspondence or supplemental test reports, as determined by the QAR/test director or test agency.

6.3.2 Installation Agency. The installation agency will be responsible for conducting QC and debugging. In accordance with CCCR 702-4, the installation agency will designate a QC representative (QCR) who will establish and maintain a QC system. The QC system will assure that assessments of quality are conducted in accordance with established procedures and that the results of the agency's QC inspections and

follow-on actions are adequately recorded. USACEEIA Form 112-R (fig. 6-3) may be used for this purpose. The records are to be made available for review and evaluation by the Test Agency's QAR/Test Director. the shakdown checkouts are to be satisfactorily completed and necessary corrections made prior to offering the equipment for acceptance testing. The installation activity's QC system must meet all procedures contained in USACEI Bn Pam 105-3. The installation agency will designate a QAR, who will assure that the following action are expiditiously performed:

- a. Assure that QC procedures are effectively applied on this installation and establish reporting requirements consistent with this project, the SEIP, and all policies. Assure that discrepancies relating to the installation are resolved and corrected at the earliest possible point in the installation effort.
- b. Assure the QC inspection records and installation documentation are maintained onsite and readily available to the QAR/test director. When the onsite effort is completed, the QC documentation shall be placed in the project files and maintained for 1 year.
- c. Assure the availability of test equipment onsite to perform debugging tests in conjunctionn with participating elements. The operating agency is to supply test equipment when it is common to operations and maintenance (0&M) functions.
- d. Assure the debugging is satisfactorily completed and all corrective actions are completed prior to starting acceptance test.
- e. Provide the QAR/test director with a statement of readiness when the installation will be ready to start acceptance tests. The notice will be given not less than 15 days prior to the scheduled start of acceptance tests to allow the QAR/test director to coordinate test support and complete travel arrangements.
- f. Assure that the QCR and an adequate complement of personnel, as necessary, remain onsite to assist in the final QA inspection and acceptance test.
- 6.3.3 Operating Agency. The operating agency will designate a representative early in the project but no later than the start of installation. This representative will assure that the following actions are taken and expeditiously completed:
 - a. Provide adminstrative and typing support.

The second secon

b. Serve as interface between the operating agency and the installation and QA/test personnel.

	TEST ENG NEER/QUALITY ASSURANCE REPRESE	NTATIVE (QAR)		

Figure 6-3. QA Inspection Checklist - Installation (Continued).

- c. Assist in resolution of discrepancies and deficiencies.
- d. Provide O&M personnel to assist on an as-required basis.
- e. Provide a representative to witness the acceptance test and sign the TAR.
 - f. Provide test equpment as agreed upon in the PCL.
- 6.4 Special Considerations.
- 6.4.1 <u>Interruptions</u>. Any inspection that is interrupted because of equipment malfunction shall be restarted at a point determined appropriate by the QAR/test director.
- o.4.2 Substitutions. Spare equipment may be substituted for malfunctioning equipment with the approval of the QAR/test director. Any repaired equipment shall be retested. During acceptance tests, no piece of equipment, including cables, conduit, etc., may be changed or adjusted without the approval of the QAR/test director.
- 6.4.3 Corrections or Modifications of Documentation. Site plans, specifications, SEIPs, drawings etc., are to be acquired by QC, QA, and test personnel prior to commencement of their respective work effort. Any drawing discrepancies noted shall be corrected using yellow markings to record deleions, red markings to record additions, and blue markings for notes to the draftsman. The designated installation agency representative will deliver a copy of the marked-up drawings to the onsite USACEEIA project engineer, and in the absence of an engineer, to: Commander, HQ USACEEIA, ATTN: CCC-CED, Fort Huachuca, AZ 85613. In all cases, a complete set of marked-up drawings will be left onsite to be maintained by the operating agency.

SECTION 7. ACCEPTANCE TEST AND PROCEDURES

7.1 General. This section contains the test procedures and states the special conditions which apply to shakedown and checkout and acceptance tests. Onsite tests are performed to determine if the designated SRT configuration has been installed correctly, performs in accordance with the technical requirements of this SEIP and subsidiary documents, and is operationally suitable for the intended application.

7.2 Testing.

- 7.2.1 Snakedown Test and Checkout. Functional tests will be conducted by the USACEI-Bn for the purpose of assuring that the equipment is aligned and operable and the installation is in accordance with the engineering documentation. These tests and checkouts will be conducted in coordination with personnel of the operating agency (the user) using applicable technical bulletins and technical manuals available. These tests will be conducted prior to the USACEI Bn offering the installation for acceptance tests. As stated in section 6, the USACEI Bn is to anticipate the installation completion date and will notify the test agency of this completion not less than 15 days in advance of scheduled date.
- 7.2.2 Onsite Acceptance Tests. Onsite acceptance testing will be accomplished by the test director in accordance with the Category III Operational and Acceptance Test Plan, 23 August 1977. These tests will be preceded by a thorough QA inspection in accordance with the requirements of section 6. Tests will be conducted in a normal operating environment. Abnormal ambient conditions (e.g., temperature, numidity, or barometric pressure) during any test will be noted with detailed remarks included with the test results. The test director will determine if any retesting is required. The operating agency will provide personnel to operate and maintain the equipment during tests. USACEI Bn will provide personnel, if available, to assist the test director in the conduct of tests and measurements.
- 7.2.3 Test Equipment. A complete listing of the required test equipment is contained in the appropriate technical manuals. Although the USACEI Bn is responsible for assuring that the required complement of test equipment is available for installation, inspection and test purposes, this test equipment should be available from the onsite resources.
- 7.2.4 Technical Acceptance Recommendation (TAR). Based on the QA inspections, QC reports and documentation, and acceptance test results the test director will determine the acceptability of the work effort. Prior to actual rejection, if the circumstances so warrant, the test director will attempt to coordinate his determination with the HQ

SEIP 041 30 October 1981

USACEEIA, the operating agency, and the USACSA DPM. The test director will prepare and distribute the TAR in accordance with the requirements of section 8. Preparation of the TAR will be accomplished onsite immediately following acceptance tests.

- 7.2.5 Test Results. When one or more tests fail to meet requirements, the test director will determine which portion(s) of the test was affected and which portions of the equipment or facility is to be retested. All deficiencies will be corrected, or, if not corrected, the deficiencies will be reported on the TAR and in the final test report.
- 7.2.6 Final Test Report. The test agency will prepare and distribute a test report in accordance with USACEEIA Regulation 702-2 as amended by the individual SEIP and tasking documents. Copies of the completed TAR will be included.

SECTION 8. COMPLETION CERTIFICATION

SEIP 041

- 8.1 General. The results of the quality assurance inspections and acceptance test specified in section 6, and 7 of this SEIP will be documented onsite by the QAR/test director using USACEEIA Form 98-R, Technical Acceptance Recommendation (TAR) (fig. 8-1). The purpose of the TAR is to record significant project information to include the scope of the effort, results and conclusions of the requisite inspections and tests, exceptions to the technical requirements, and recommendations regarding acceptance with or without exceptions or rejection of the work effort. The TAR also provides participants the opportunity to indicate agreement or disagreement with the inspection and test assessments and for user consent to accept the installed equipment. Additional informaton on TAR usage and instructions for completion are provided in CCCR 702-2.
- 8.2 <u>Distribution</u>. A copy of the TAR will be provided to the signing participants and the operating agency. The original copy will be maintained in the test agency project files and copies will be included in the test report.
- 3.3 Waivers. Waivers to include command approvals for individual installations will be recorded in the TAR with copies attached to define and clarify deviations from this SEIP.

INSTRUCTIONS TECHNICAL ACCEPTANCE RECOMMENDATION (TAR)

- 1. Entries on the data sheets are to be typed whenever possible to insure legibility and provide a quality, fully legible product when reproduced. If a typewriter is not available, the forms may be completed by printing with black ink in block letters to insure legibility. The instructions for completion of this form follow on a block-by-block basis.
- 2. Pages are to be sequentially numbered to show both the individual page number and the total number of pages constituting the completed TAR. Additionally, each page will be identified by the date and project/contract number in the appropriate blocks.
- 3. Instructions for completion of the TAR are delineated in the following subparagraphs and will be adhered to:
- a. DATE: Enter the day, month, and year of completion for this action (e.g., 1 January 1979).
- b. <u>PROJECT/CONTRACT NUMBER</u>: Enter the appropriate project of contract number. If this is a subproject or part of a subproject, provide all necessary information (i.e., IIP milestone number(s), subproject number(s) as well as subdivision(s) to same).
 - c. <u>TITLE</u>: Enter the project name or title.
- d. LOCATION: Enter the geographic location where the project was installed.
- e. FACILITY: Enter the name of the facility and other pertinent identifying information.
- f. TEST DIRECTOR: Enter the name, title, and grade of the Test Director or Quality Assurance Representative assigned to this project.
- g. OPERATING AGENCY: Enter the name, symbol, and complete mailing address of the organization having O&M responsibility for this project, system, or equipment installation.
- h. ENGINEERING AGENCY: Enter the name, symbol, and complete mailing address of the organization having engineering cognizance and responsibility.
- i. INSTALLATION AGENCY: Enter the name, symbol, and complete mailing address of the organization having been tasked to install the TAR material.
- j. TESTING AGENCY: Enter the name, symbol, and complete mailing address of the Quality Assurance and Testing organization tasked for this project.

k. PROJECT DESCRIPTION: Enter a brief and concise description of the project to which the TAR applies.

- 1. MAJOR EQUIPMENT INSTALLED/RELOCATED: List the major items of equipment installed or relocated in accordance with the project requirements. Enter the Bill of Material (BOM) line item number, material description, assigned part number or federal stock number, and the quantity of each major item. Components, assemblies, and subassemblies configured into a major item as listed in SB 700-20 or CCP 700-20 should also be recorded. Additional pages, numbered in sequence, may be added as required.
- m. <u>DOCUMENTATION</u>: Enter the document identification (i.e., drawing number, technical manual number, etc.), title, and the quantity of each document provided to the operating unit as part of the project.

n. EXCEPTIONS:

- (1) Upon completion of installation and testing, any exceptions to the project requirements which require corrective action will be listed. Include complete identification of each missing item. Exceptions must be based on the specified requirements of the project, supportable through the test results or other valid documentation, fully described, and precisely identified.
- (2) The appropriate exception block must be annotated and separate sneets should be used for each category of exception.
- (3) The Test Director will also enter the suggested action agency for each exception, recognizing that the Test Director may not always be in a position to determine the final action agency.
- (4) For facilities that are becoming partially operational, identify installation agency actions remaining for project completion. In this situation, the TAR will show the tests that have been made, but will be identified as a partial record. A final TAR will be prepared after installation and testing of all remaining project equipment.
- o. REMARKS: The remarks section may be used to provide any additional information on or in support of a recommendation, commendation, or criticism in relation to the project installation, engineering, or testing. Entries may include:
- (1) Shortcomings which do not require corrective action (not considered an exception).
 - (2) Recommendations for improving projects of a similar nature.
- (3) Identification of support items that have not been accomplished, and a description of any activity in progress by the operating agency to satisfy the requirement.

- (4) A description of test results with the performing agency and date(s) accomplished.
- (5) A statement to the effect that the installation agency will forward final "as built" drawings when completed.
- (6) A description of the AC power system with identification of source and backup capability.
- (7) A statement to indicate that a list of excess material was provided the operating command for final disposition or to identify material that was excess to the project.
- p. CERTIFICATION: Enter the signatures and certification that the project was installed, tested, and accepted for operation with or without exceptions as applicable.
